

Good authentication

Description: After your first strike, the development team has increased the power of there login function. Are you strong enough to break it again?

Level: Level 1

Type: Coding

Link: <https://ctf.securityvalley.org/dashboard>

So we got an authentication js code,a bit harder thant the 1st one:

```
const readline = require('readline').createInterface({
  input: process.stdin,
  output: process.stdout
});

readline.question('Please enter password \n', password => {

  console.log(`Gonna check if ${password} is correct`);

  readline.close();

  validate(password)

});

function validate(password) {

  if (password.length !== 12) {

    throw new Error("pass violation. wrong password length");
```

```
}

const block1 = Array.from(password).slice(0, 4)

const block2 = Array.from(password).slice(4, 8)

const block3 = Array.from(password).slice(8, 12)

const block = [

block1,

block2,

block3

]

let crafted = "";

for (let i = 0; i < block.length; i++) {

for (let a = 0; a < block[i].length; a++) {

if (i == 0) {

crafted += String.fromCharCode(String(block[i][a]).charCodeAt(0) ^ 7)

} else if (i == 1) {

crafted += String.fromCharCode(String(block[i][a]).charCodeAt(0) ^ 11)

} else {

crafted += String.fromCharCode(String(block[i][a]).charCodeAt(0) ^ 9)

}

}

}

}

if(crafted !== "sontTbxTjffe") {
```

```

throw new Error("pass violation. wrong credentials");

}

banner(password);

}

function banner(payload) {

console.info("that was great !!!");

console.info("run the following command to get the flag.")

console.info(`curl -X POST http://ctf.securityvalley.org:7777/api/v1/validate -H 'Content-Type: application/json' -d
'{"pass": "${payload}"}`)

}

```

At the end, we can see that the "final pass" need to be **sontTbxTjffe**. The pass is in 3 part:

```

sont ^ 7
TbxT ^ 11
jffe ^ 9

```

This is **Xor** (algo) so let's decode with cyberchef:

Operations

- xor
- XOR
- XOR Brute Force
- XXCD Random Number
- Hex to Object Identifier
- Unicode Text Format
- Text Encoding Brute Force
- Lorenz
- Magic
- Favourites
- Data format
- Encryption / Encoding
- Public Key
- Arithmetic / Logic
- Networking
- Language
- Utils
- Date / Time
- Extractors
- Compression
- Hashing

Recipe

XOR

Key: 7 HEX

Scheme: Standard ☐ Null preserving

Input

son

start: 0 end: 4 length: 4
end: 4 length: 4
length: 4 lines: 1

Output

this

start: 0 end: 4 length: 4
end: 4 length: 4
length: 4 lines: 1

```
sont = this  
TbxT = _is_  
jffe = cool
```

So the password is `this_is_cool`, so we need to replace the `{payload}` with `this_is_cool`, so we enter: `curl -X POST http://ctf.securityvalley.org:7777/api/v1/validate -H 'Content-Type: application/json' -d '{"pass": "this_is_cool"}'`

```
msf5@DESKTOP-1F4TD11:~$ curl -X POST http://ctf.securityvalley.org:7777/api/v1/validate -H 'Content-Type: application/json' -d '{"pass": "this_is_cool"}'
{"Value": "SecVal{9R34t_y0u_X0R3d}"}
msf5@DESKTOP-1F4TD11:~$
```

The flag appear !

The flag is: **SecVal{9R34t_y0u_X0R3d}**
